

Giorgi Samsiani

Full-Stack Web Developer

Web applications · online stores · system integrations

I build websites and online stores that load fast, connect to banks and ERP systems, and stay reliable under heavy traffic.

01 Profile

I am a full-stack web developer based in Tbilisi. For more than ten years I have built and maintained commercial websites, online stores and internal business tools for companies in Georgia and abroad.

On the front end I use Next.js, React, Vue and TypeScript; on the back end PHP, Laravel, Node.js and WordPress. I write custom themes and plugins, set up and repair WooCommerce stores, and run headless architectures where the CMS only serves data to a separate interface. I also make mobile apps with React Native, admin dashboards and internal CRM tools, and I manage the Linux servers, deployment and caching behind them.

A large part of my work is integration. I connect shops to bank payment and installment systems, to ERP and accounting software, and to delivery, SMS and CRM providers. I design the sync engines that keep products, stock, prices and orders correct on both sides.

I also develop and sell my own line of WordPress and WooCommerce plugins, so I write code that other developers use as well. Performance, security and technical SEO are part of every project, not an afterthought.

02 Stack & skills

■ Core – daily, production ■ Strong – regular □ Working – as needed

WordPress & WooCommerce

Custom WordPress development · themes, child themes, CPTs, ACF
■ CORE

Plugin architecture · hooks, REST, cron, WP-CLI, auto-updates
■ CORE

Multilingual · WPML, Polylang, TranslatePress, custom engine
■ CORE

WooCommerce customisation · checkout, product types, pricing, roles
■ CORE

Page builders · Divi, Avada, Elementor, WPBakery, Gutenberg / FSE
■ CORE

Performance · LiteSpeed Cache, Redis object cache, WP Rocket
■ STRONG

Headless WordPress · REST, WPGraphQL, Store API behind Next.js
■ CORE

Premium themes · WoodMart, Flatsome, Astra, Kadence
■ STRONG

Security & hardening · WAF, malware cleanup, backups, updates
■ STRONG

Grouped by where each tool sits in a system. The level shows how much I use it in production, not how well I think I know it.

	Migrations & maintenance · hosting moves, PHP upgrades, staging STRONG		
Front end & UI	TypeScript CORE	React 19 CORE	Next.js 16 · App Router, server actions CORE
	Vue 3 + Vite STRONG	Tailwind CSS STRONG	Modern CSS · container queries, view transitions, oklch STRONG
	Figma → production STRONG	Accessibility · WCAG 2.1 AA STRONG	Design systems · tokens, components, dark mode STRONG
	Expo / React Native WORKING		
Back end & data	PHP 8 CORE	WooCommerce internals · gateways, shipping, Store API, HPOS CORE	MySQL / MariaDB CORE
	REST & GraphQL API design CORE	Laravel 12 STRONG	Node.js + Hono STRONG
	SQLite STRONG	Redis & object caching STRONG	Queues, cron & background jobs STRONG
	Python / Django WORKING		
Payments & integrations	Bank payment gateways · BOG, TBC, Liberty, Credo, Flitt, iPay CORE	Installment & BNPL flows CORE	ERP synchronisation · 1C, Fina, Balance CORE
	Webhooks, polling & reconciliation CORE	Apple Pay via bank processors STRONG	Delivery & logistics APIs STRONG
	SMS gateways STRONG	OAuth 2 / SSO / JWT STRONG	
Infrastructure & delivery	Linux VPS administration CORE	OpenLiteSpeed / CyberPanel CORE	GitHub Actions CI/CD CORE
	Cloudflare · DNS, cache rules, WAF, bot control CORE	cPanel / DirectAdmin STRONG	nginx / Apache / php-fpm STRONG
	PM2 & Node process management STRONG	TLS / ACME, LiteSpeed Cache STRONG	Mail · Postfix, Dovecot, Exim, DMARC WORKING
	Docker WORKING		
SEO, performance & analytics	Technical SEO CORE	Core Web Vitals & LCP tuning STRONG	Structured data · JSON-LD STRONG
	i18n & hreflang STRONG	Crawl budget & faceted-navigation control STRONG	Google Search Console & crawl diagnostics STRONG
	GA4 · Tag Manager · Looker Studio STRONG	Rank Math / Yoast STRONG	

Engineering practice & AI tooling

Git · trunk-based, semantic releases

■ CORE

Claude Code & agentic workflows

■ CORE

Multilingual products · WPML, Polylang & custom engines

■ CORE

Vitest · PHPUnit · test-gated CI

■ STRONG

MCP servers & tool integration

■ STRONG

Technical writing · specs, runbooks, changelogs

■ STRONG

03 What I can own end to end

Work I take on and see through to production.

01 Figma to production

I turn a design file into a working Next.js or Vue front end with typed components, accessible markup and a real build pipeline.

02 Custom WordPress builds

I model the content the way the business works, using custom post types, ACF fields and editor-friendly blocks, and write a theme that stays fast as the site grows.

03 Headless WordPress

WordPress stays the editing tool and the data source through REST, WPGraphQL and the Store API, while visitors get a fast Next.js front end.

04 Undocumented APIs

When a bank, ERP or delivery API has partial or outdated documentation, I map its real behaviour by testing endpoints, logging every request and response, and reconciling state by polling.

05 Plugins other developers use

I release WordPress and WooCommerce plugins with licensing, automatic updates, database migrations, safe activation and a clean uninstall.

06 Store rescue

I take over a slow, hacked or unfinished WooCommerce site, audit it, remove the damage, update PHP and plugins, and bring the loading speed back to normal.

07 Production diagnostics

I use access logs, slow query logs and server metrics to find what actually causes a slowdown, instead of restarting services at random.

08 Sync engines

I design one-way and two-way sync between shops and ERP systems, with safe repeated writes, sanity checks on incoming data, a dry-run mode and a pause switch.

09 Multilingual by default

I build Georgian and English versions from the start, so every URL, template and cache entry is tied to its language.

04 How I work

The practices I follow on every project.

Check the code before blaming the cache.

I reproduce every bug and trace it to a specific line before changing anything. A guess is not a diagnosis.

Small, verified steps.

I build in thin slices and verify the visible result once before moving on. No large rewrites, no untested changes.

Read-only until told otherwise.

I treat live data, client shops and third-party systems as read-only unless the task is specifically to change them.

Plan, then build, then review.

Complex work starts with a written plan that we agree on. It is then built in parts, tested and released through CI.

Logs that answer questions.

Every payment, sync and API call records its full request and response, so a later problem can be traced instead of guessed at.

Async and written.

Clear commit messages, changelogs and short guides, so the next person can continue exactly where I stopped.

05 Principles

Rules I follow in production work.

- | | | |
|----|--|--|
| 01 | Performance is a constraint, not a feature. | Extra database work on a page that runs on every request is a bug and is fixed like one. |
| 02 | Data integrity beats convenience. | A sync that can delete half the data after one incomplete response needs a safety check before it gets any new features. |
| 03 | Production changes go through CI. | Deploys happen from a pushed commit, never from a hand-copied file. Rollback is a revert. |
| 04 | The source of truth is decided in advance. | One-way syncs stay one-way. When two systems disagree, the design already says which one is right. |
| 05 | Every integration is observable. | Requests, statuses and identifiers are logged, and local records match the provider within one sync cycle. |
| 06 | Simple solutions win. | Standard tools, clear configuration, fewer moving parts. Clever code is harder for the next person to maintain. |
-

06 Experience

2018 – PRESENT

Founder & Lead Developer

Samsiani Web

Independent studio providing web development, technical SEO and hosting for clients in retail, industrial B2B, consumer lending, automotive and education. Work includes WordPress and WooCommerce sites on Divi, Avada, Elementor and WoodMart, custom plugins, and headless Next.js front ends. I am the long-term engineering partner for several large online stores, covering payments, ERP sync, speed and infrastructure.

2022 – PRESENT

Founder, plugins

CodeOn.ge

A line of WordPress and WooCommerce plugins for online stores: card and installment payments, ERP sync, delivery, SMS and a multilingual engine. Each product ships with licensing, automatic updates, documentation and support.

2017 – PRESENT

Web Developer & Project Manager

E-commerce brands

I build and maintain online stores and corporate sites for wine, fashion, furniture and retail brands, covering development, optimisation, technical support and on-page and off-page SEO.
